

Simulation of UI Design Lifecycle Using RAD Model with Axure RP

Name: MUKILRAJ .S

Roll.no: 240701341

1. Introduction

This project demonstrates the **User Interface (UI) design lifecycle** using the **Axure RP** tool, following the **Rapid Application Development (RAD)** model.

The aim is to design and simulate a **food ordering mobile application interface** called “**ODERLY**”, focusing on fast development, user feedback, and iterative improvements.

2. About RAD Model

The **Rapid Application Development (RAD)** model emphasizes:

- Quick prototyping
- User involvement
- Fast delivery
- Iterative updates

Phases of RAD Model:

1. **Requirement Planning**
2. **User Design**
3. **Construction**
4. **Cutover (Deployment)**

3. UI Design Lifecycle Implementation

3.1 Requirement Planning

In this phase, the main requirements of the food ordering app were identified:

- User login system
- Food browsing (categories like appetizers, desserts, drinks)
- Product details view
- Add to cart functionality
- Order confirmation

3.2 User Design (Wireframing & Prototyping)

Using **Axure RP**, multiple UI screens were created:

a) Splash Screen

- Displays app name **ODERLY**
- Food-themed icon (fork, knife, spoon)
- Represents app branding

b) Login Screen

- Fields: Email & Password
- Login button
- Alternative login option
- Signup link

c) Home Screen

- Greeting message: “Hi Goku, are you hungry?”
- Category tabs: All, Appetizer, Dessert, Drinks
- Food list with:

- Image
- Name

d) Product Detail Screen

- Food image (e.g., Biryani)
- Price breakdown:
 - Food cost
 - Service cost
 - Delivery cost
 - Total cost
- “Add to Cart” button

e) Confirmation Screen

- Message: “Product added to cart”
- Options:
 - Continue shopping
 - Continue to cart

3.3 Construction Phase

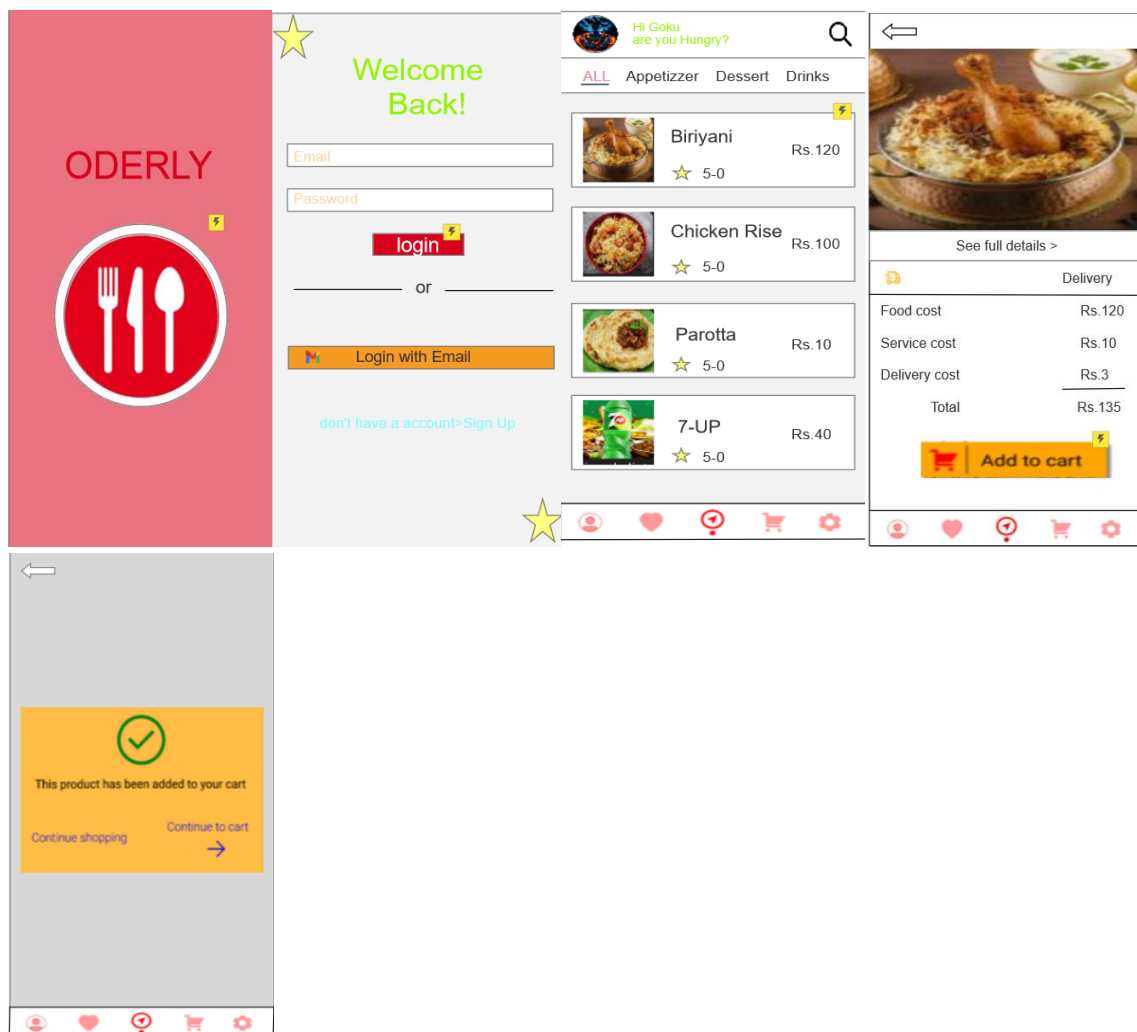

In this phase:

- Interactive elements were added in **Axure RP**
- Navigation between screens was implemented
- Buttons (Login, Add to Cart) were linked
- Dynamic behavior simulated (e.g., page transitions)

3.4 Cutover Phase

- Final prototype was tested
- UI usability was evaluated

- Minor improvements were made based on feedback

4. Features of the Designed Interface

- Simple and clean layout
- User-friendly navigation
- Categorized food items
- Interactive buttons and transitions
- Real-time simulation of app flow

5. Advantages of Using Axure RP with RAD

- Faster UI development

- Easy prototyping without coding

6. Conclusion

This project successfully demonstrates how the **RAD model** can be applied to **UI design** using **Axure RP**.

By creating multiple interactive screens such as login, home, product details, and confirmation pages, the lifecycle of UI development was effectively simulated. The approach ensures **rapid development, continuous feedback, and improved usability**, making it suitable for modern application design.

- Improve UI animations
- Connect prototype to real backend
